#### Vectors

• Vectors are ordered list of numbers (scalars). 
$$\mathbf{v} = \begin{bmatrix} 1.2 \\ -0.1 \\ \vdots \\ -1.24 \end{bmatrix}$$
.

Note: Small bold letter will represent vectors. e.g.  $\bar{\mathbf{a}}, \mathbf{x}, \dots$ 

- Scalars can be any *field* ℝ, ℂ, ℤ, ℚ. Scalars will be represented using lower case normal font, e.g. x, y, α, β,...
- Addition and multiplication operations performed on vectors will follow the rules of addition/multiplication of the corresponding scalar fields.
- $\blacktriangleright$  We will typically only encounter only  ${\mathbb R}$  and  ${\mathbb C}$  in this course.

# Vectors

- lndividual elements of a vector  $\mathbf{v}$  are indexed. The  $i^{th}$  element of  $\mathbf{v}$  is referred to as  $v_i$ .
- *Dimension* or *size* of a vector is number of elements in the vector.
- Set of *n*-real vectors is denoted by  $\mathbb{R}^n$  (similarly,  $\mathbb{C}^n$ )
- $\blacktriangleright$  Vectors  ${\bf a}$  and  ${\bf b}$  are equal, if
  - both have the same size; and
  - ▶  $a_i = b_i, i \in \{1, 2, 3, ..., n\}$

### Vectors

$$\blacktriangleright \text{ Unit vector } \mathbf{e}_1 = \begin{bmatrix} 1\\0\\0\\\vdots\\0 \end{bmatrix} \text{ Zero vector } \mathbf{0} = \begin{bmatrix} 0\\0\\0\\\vdots\\0 \end{bmatrix} \text{ One vector } \mathbf{1} = \begin{bmatrix} 1\\1\\1\\\vdots\\1 \end{bmatrix}$$

• Geometrically, real *n*-vectors can be thought of as points in  $\mathbb{R}^n$  space.

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

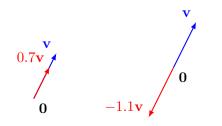

# Vectors

 Vector scaling: Multiplication of a scalar and a vector.

#### Properties

Scalar multiplication is *commutative*.

$$\mathbf{w} = a\mathbf{v} = a \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ \vdots \\ v_n \end{bmatrix} = \begin{bmatrix} av_1 \\ av_2 \\ av_3 \\ \vdots \\ av_n \end{bmatrix} a \in \mathbb{R}; \ \mathbf{w}, \mathbf{v} \in \mathbb{R}^n \quad \blacktriangleright \text{ Scalar multiplication is associative.}$$
$$(\alpha\beta) \mathbf{v} = \alpha \ (\beta\mathbf{v})$$

Scalar multiplication is *distributive*.

$$(\alpha + \beta) \mathbf{v} = \alpha \mathbf{v} + \beta \mathbf{v}$$

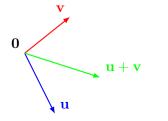

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 - シスペ

 $\mathbb{R}^{n}$ 

# Vectors

Vector addition: Adding two vectors of the same dimension, element by element.

$$\mathbf{u} + \mathbf{v} = \begin{bmatrix} u_1 \\ u_2 \\ u_3 \\ \vdots \\ u_n \end{bmatrix} + \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ \vdots \\ v_n \end{bmatrix} = \begin{bmatrix} u_1 + v_1 \\ u_2 + v_2 \\ u_3 + v_3 \\ \vdots \\ u_n + v_n \end{bmatrix} \quad \mathbf{u}, \mathbf{v} \in$$

#### Properties

► Vector addition is *commutative*.

$$\mathbf{a} + \mathbf{b} = \mathbf{b} + \mathbf{a}$$

- Vector addition is associative.
  - $(\mathbf{a} + \mathbf{b}) + \mathbf{c} = \mathbf{a} + (\mathbf{b} + \mathbf{c})$
- Zero vector has no effect.

 $\mathbf{a} + \mathbf{0} = \mathbf{a}$ 

Subtraction of vectors.

$$\mathbf{a} + (-1)\mathbf{a} = \mathbf{a} - \mathbf{a} = \mathbf{0}$$

#### 8/20

## Vector spaces

▶ A set of vectors V that is closed under vector addition and vector scaling.

 $\forall \mathbf{x}, \mathbf{y} \in V, \ \mathbf{x} + \mathbf{y} \in V$ 

 $\forall \mathbf{x} \in V, \text{ and } \alpha \in F, \ \alpha \mathbf{x} \in V$ 

For a set to be a vector space, it must satisfy the followng properties:  $\mathbf{x}, \mathbf{y}, \mathbf{z} \in V$ 

- Commutativity:  $\mathbf{x} + \mathbf{y} = \mathbf{y} + \mathbf{x}$
- Associativity of vector addition:  $(\mathbf{x} + \mathbf{y}) + \mathbf{z} = \mathbf{x} + (\mathbf{y} + \mathbf{z})$
- Additive identity:  $\mathbf{x} + \mathbf{0} = \mathbf{0} + \mathbf{x} = \mathbf{x} \ (0 \in V)$
- Additive inverse:  $\exists -\mathbf{x} \in V, \mathbf{x} + (-\mathbf{x}) = \mathbf{0}$
- Associativity of scalar multiplication:  $\alpha(\beta \mathbf{x}) = (\alpha \beta \mathbf{x})$
- Distributivity of scalar sums:  $(\alpha + \beta) \mathbf{x} = \alpha \mathbf{x} + \beta \mathbf{x}$
- Distributivity of vector sums:  $\alpha (\mathbf{x} + \mathbf{y}) = \alpha \mathbf{x} + \alpha \mathbf{y}$
- Scalar multiplication identity:  $1\mathbf{x} = \mathbf{x}$

• We will mostly deal with  $\mathbb{R}^n$  and  $\mathbb{C}^n$  vectors spaces in this course.

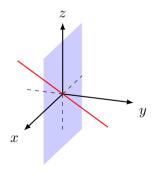

# Subspaces

 $\blacktriangleright$  A subspace S of a vector space V is a subset of V and is itself a vector space.

$$S \subset V, \quad \forall \mathbf{x}, \mathbf{y} \in S, \, \alpha \mathbf{x} + \beta \mathbf{y} \in S, \, \, \alpha, \beta \in F$$

▶ The zero vector is called the **trivial subspace** of a vector space V.

For example in, in  $\mathbb{R}^3$  all planes and lines passing through the origin are subspaces of  $\mathbb{R}^3$ .

#### 10/20

# Linear independence

▶ A collection of vectors  $\{\mathbf{x}_1, \mathbf{x}_2, \mathbf{x}_3, \dots, \mathbf{x}_n\}$ ,  $\mathbf{x}_i \in \mathbb{R}^m$   $i \in \{1, 2, 3, \dots, n\}$  is called *linearly dependent* if,

$$\sum_{i=1}^{n} \alpha_i \mathbf{x}_i = 0, \text{ hold for some } \alpha_1, \alpha_2, \dots \alpha_n \in \mathbb{R}, \text{ such that } \exists \alpha_i \neq 0$$

Another way to state this: A collection of vectors is *linearly dependent* if at least one of the vectors in the collection can be expressed as a linear combination of the other vectors in the collection, i.e.

$$\mathbf{x}_i = -\sum_{j=1, j \neq i}^n \left(\frac{\alpha_j}{\alpha_i}\right) \mathbf{x}_j$$

► A collection of vectors is *linearly independent* if it is **not** *linearly dependent*.

$$\sum_{i=1}^{n} \alpha_i \mathbf{x}_i = 0 \implies \alpha_1 = \alpha_2 = \alpha_3 \dots = \alpha_n = 0$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ の00

# Span of a set of vectors

- Consider a set of vectors  $S = {\mathbf{v}_1, \mathbf{v}_2, \mathbf{v}_3 \dots \mathbf{v}_r}$  where  $\mathbf{v}_i \in \mathbb{R}^n, 1 \le i \le r$ .
- **>** The span of the set S is defined as the set of all linear combination of the vectors  $\mathbf{v}_i$ ,

$$span(S) = \{\alpha_1 \mathbf{v}_1 + \alpha_2 \mathbf{v}_2 + \ldots + \alpha_r \mathbf{v}_r\}, \ \alpha_i \in \mathbb{R}$$

- ► Is span(S) a subspace of  $\mathbb{R}^n$ ?
- We say that the subspace span(S) is spanned by the spanning set  $S. \longrightarrow S$  spans span(S).
- **Sum of subspaces** X, Y is defined as the sum of all possible vectors from X and Y.

$$X + Y = \{\mathbf{x} + \mathbf{y} \mid \mathbf{x} \in X, \mathbf{y} \in Y\}$$

Sum of two subspace is also a subspace.

# Inner Product

Standard inner product is defined as the following,

$$\mathbf{x}^T \mathbf{y} = \sum_{i=1}^n x_i y_i, \ \mathbf{x}, \mathbf{y} \in \mathbb{R}^n$$

For complex vectors:  $\mathbf{x}^*\mathbf{y} = \sum_{i=1}^n \overline{x}_i y_i, \;\; \mathbf{x}, \mathbf{y} \in \mathbb{C}^n$ 

#### Properties

• 
$$\mathbf{x}^T \mathbf{x} > 0$$
,  $\forall \mathbf{x} \neq 0$  and  $\mathbf{x}^T \mathbf{x} = 0 \Leftrightarrow \mathbf{x} = 0$ 

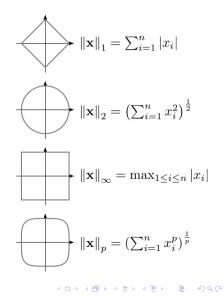

- $\blacktriangleright \quad Commutative: \ \mathbf{x}^T \mathbf{y} = \mathbf{y}^T \mathbf{x}$
- Associativity with scalar multiplication:  $(\alpha \mathbf{x})^T \mathbf{y} = \alpha (\mathbf{x}^T \mathbf{y})$
- Distributivity with vector addition:  $(\mathbf{x} + \mathbf{y})^T \mathbf{z} = \mathbf{x}^T \mathbf{z} + \mathbf{y}^T \mathbf{z}$

# Norm

- Norm is a measure of the size of a vector.
- Euclidean norm of a *n*-vector  $\mathbf{x} \in \mathbb{R}^n$  is defined as,  $\|\mathbf{x}\|_2 = \sqrt{\mathbf{x}^T \mathbf{x}} = \sqrt{\sum_{i=1}^n x_i^2}.$
- $\|\mathbf{x}\|_2$  is a measure of the length of the vector  $\mathbf{x}$ .
- Any function of the form ||●|| : ℝ<sup>n</sup> → ℝ<sub>≥0</sub> is a valid norm, provided it satisfies the following properties.

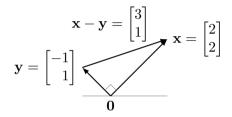

### Properties

- Definiteness.  $\|\mathbf{x}\| = 0 \iff x = 0$
- Non-negativity.  $\|\mathbf{x}\| \ge 0$
- ▶ Non-negative homogeneity.  $\|\beta \mathbf{x}\| = |\beta| \|\mathbf{x}\|, \beta \in \mathbb{R}$
- Triangle inequality.  $\|\mathbf{x} + \mathbf{y}\| \le \|\mathbf{x}\| + \|\mathbf{y}\|$
- *p*-norm:  $\|\mathbf{x}\|_p = (\sum_{i=1}^n |x_i|^p)^{\frac{1}{p}}$
- ▶ Norm of difference between two vectors is a measure of the distance between the vectors. d = ||x y||<sub>2</sub>.

# Orthogonality

 $\blacktriangleright$  Orthogonality is the idea of two vectors being perpendicular,  $\mathbf{x} \perp \mathbf{y}.$ 

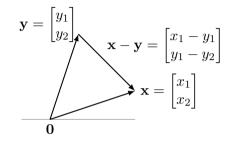

Using the Pythagonean theorem,  $\|\mathbf{x} - \mathbf{y}\|^2 = \|\mathbf{x}\|^2 + \|\mathbf{y}\|^2$ 

$$\|\mathbf{x}\|^{2} + \|\mathbf{y}\|^{2} - 2\mathbf{x}^{T}\mathbf{y} = \|\mathbf{x}\|^{2} + \|\mathbf{y}\|^{2} \implies \mathbf{x}^{T}\mathbf{y} = 0$$

▶ We extend this to the *n*-dimensional case and define two vectors  $\mathbf{x}, \mathbf{y} \in \mathbb{R}^n$  being orthogonal, if

$$\mathbf{x}^T \mathbf{y} = \sum_{i=1}^n x_i y_i = 0$$

# Angle between vectors

- ▶ Inner products are used for projecting a vector onto another vector or a subspace.
- ▶ It is also a measure of similarity between two vectors,  $\cos(\theta) = \frac{\mathbf{x}^T \mathbf{y}}{\|\mathbf{x}\| \|\mathbf{y}\|}$
- Cauchy-Bunyakovski-Schwartz Inequality:

$$\left|\mathbf{x}^{T}\mathbf{y}\right| \leq \left\|\mathbf{x}\right\| \left\|\mathbf{y}\right\|, \ \mathbf{x}, \mathbf{y} \in \mathbb{R}^{n}$$

## Basis

Consider a vector  $\mathbf{y} = \sum_{i=1}^{n} \alpha_i \mathbf{x}_i$ . What can we say about the coefficients  $\alpha_i$ s when the collection  $\{\mathbf{x}_i\}_{i=1}^{n}$  is,

- linearly independent  $\implies \alpha_i$ s are *unique*.
- linearly dependent  $\implies \alpha_i$ s are not *unique*.

Consider  $\mathbb{R}^2$  vector space.  $\mathbf{x}_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$ ,  $\mathbf{x}_2 = \begin{bmatrix} 1 \\ 1 \end{bmatrix} \mathbf{x}_3 = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$ .  $\mathbf{x}_3 = -2\mathbf{x}_1 + \mathbf{x}_2$ 

**Independence-Dimension inequality**: What is the maximum possible size of a linearly independent collection?

A linear independent collection of n-vectors can at most have n vectors.

## Basis

- ▶ A linearly independent set of n *n*-vector is called a *basis*. In particular, it is a basis of  $\mathbb{R}^n$ .
- Any *n*-vector can be represented as a *unique* linear combination of the elements of the basis.
- Consider the basis  $\{\mathbf{x}_i\}_{i=1}^n$ . A *n*-vector  $\mathbf{y}$  can be represented as a linear combination of  $\mathbf{x}_i$ s,  $\mathbf{y} = \sum_{i=1}^n \alpha_i \mathbf{x}_i$ . This is called the *expansion of*  $\mathbf{y}$  in the  $\{\mathbf{x}_i\}_{i=1}^n$  basis.
- The numbers  $\alpha_i$  are called the *coefficients* of the expansion of y in the  $\{x_i\}_{i=1}^n$  basis.
- ▶ Orthogonal vectors: A set of vectors  $\{\mathbf{x}_i\}_{i=1}^n$  is (mutually) orthogonal is  $\mathbf{x}_i \perp \mathbf{x}_j$  for all  $i, j \in \{1, 2, 3, ..., n\}$  and  $i \neq j$ .
- ▶ This set is called **orthonormal** if its elements are all of unit length  $||\mathbf{x}_i||_2 = 1$  for all  $i \in \{1, 2, 3, ..., n\}$ .

$$\mathbf{x}_i^T \mathbf{x}_j = \begin{cases} 0 & i \neq j \\ 1 & i = j \end{cases}$$

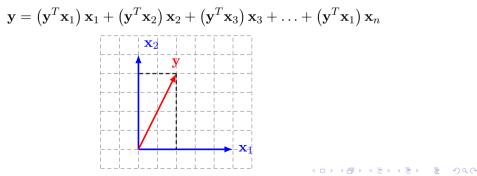

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

# Representing a Vector in an Orthonormal Basis

- ► An orthonormal collection of vectors is linearly independent.
- Consider an orthonormal basis  $\{\mathbf{x}_i\}_{i=1}^n$ . The expansion of a vector  $\mathbf{y}$  is given by,

$$\mathbf{y} = \alpha_1 \mathbf{x}_1 + \alpha_2 \mathbf{x}_2 + \alpha_3 \mathbf{x}_3 + \ldots + \alpha_n \mathbf{x}_n$$
$$\mathbf{x}_i^T \mathbf{y} = \alpha_1 \mathbf{x}_i^T \mathbf{x}_1 + \alpha_2 \mathbf{x}_i^T \mathbf{x}_2 + \alpha_3 \mathbf{x}_i^T \mathbf{x}_3 + \ldots + \alpha_n \mathbf{x}_i^T \mathbf{x}_n = \alpha_i$$

Thus, we can rewrite this as,

#### 19/20

# Dimension of a Vector Space

- ► There an infinite number of bases for a vector space.
- ▶ There is one thing that is common among all these bases the number of bases vectors.
- This number is a property of the vector space, and represents the "degrees of freedom" of the space. This is called the **dimension** of the vector space.
- $\blacktriangleright$  A subspace of dimension m can have at most m independent vectors.
- Notice that the word "dimension" of a vector space is different from the "dimension" of a vector.
- ► E.g. Vectors from R<sup>3</sup> are three dimensional vectors. But the yz-plane in R<sup>3</sup> is a 2 dimensional subspace of R<sup>3</sup>.

# Linear Functions

Let f be a function which maps real n-vectors to scalar real numbers. It can be represented as the following,

$$f: \mathbb{R}^n \longrightarrow \mathbb{R}; \ y = f(\mathbf{x}) = f(x_1, x_2, x_3, \dots x_n)$$

- Criteria for f to be a linear function: Superposition:  $f(\alpha \mathbf{x} + \beta \mathbf{y}) = \alpha f(\mathbf{x}) + \beta f(\mathbf{y})$ , where  $\alpha, \beta \in \mathbb{R}$  and  $\mathbf{x}, \mathbf{y} \in \mathbb{R}^{n}$ .
- **Inner product** is a linear function in one of the arguments.

$$f(x) = \mathbf{w}^T \mathbf{x} = w_1 x_1 + w_2 x_2 + w_3 x_3 + \ldots + w_n x_n$$

Any linear function can be represented in the form  $f(\mathbf{x}) = \mathbf{w}^T \mathbf{x}$  with an appropriately chosen  $\mathbf{w}$ .
